Table of Contents

Task 1 Set up a simple e-commerce database system with the following tables.....	3
Task 2 Insert some sample/dummy data in the above tables.....	6
Task 3 Write a Java program that does the following.....	8
Task 4 Calculate & display the SQL query execution time in milliseconds at STEPS-A, C & D.....	11

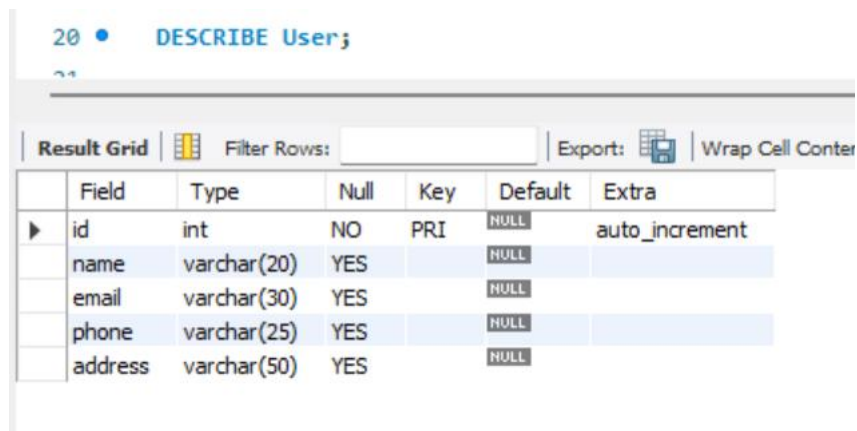

Task 1:

Set up a simple e-commerce database system with the following tables:

User table (in **Local** DB) with attributes: id, name, email, phone, address

Query –

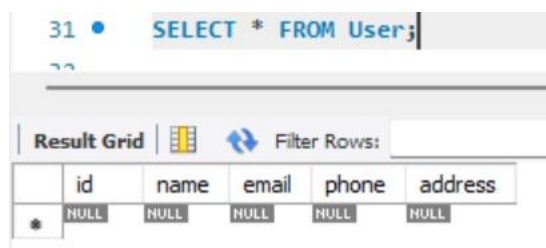

```
CREATE TABLE User (  
    id INT AUTO_INCREMENT PRIMARY KEY,  
    name VARCHAR(20),  
    email VARCHAR(30),  
    phone VARCHAR(25),  
    address VARCHAR(50)  
);
```

The screenshot shows a database interface with a query editor at the top containing the command `DESCRIBE User;`. Below the editor is a 'Result Grid' tab. The grid displays the table's structure with columns: Field, Type, Null, Key, Default, and Extra. The data rows are as follows:

Field	Type	Null	Key	Default	Extra
id	int	NO	PRI	NULL	auto_increment
name	varchar(20)	YES		NULL	
email	varchar(30)	YES		NULL	
phone	varchar(25)	YES		NULL	
address	varchar(50)	YES		NULL	

Figure 1 User: Database (local DB)

The screenshot shows a database interface with a query editor at the top containing the command `SELECT * FROM User;`. Below the editor is a 'Result Grid' tab. The grid displays the table's data with columns: id, name, email, phone, and address. The data row is as follows:

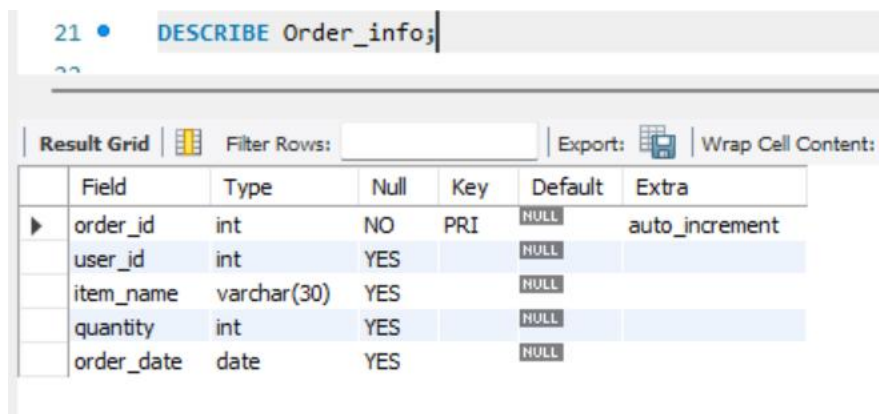

id	name	email	phone	address
*	NULL	NULL	NULL	NULL

Figure 2 User Table with no data

Order_info table (in **Local** DB) with attributes: order_id, user_id, item_name, quantity, order_date

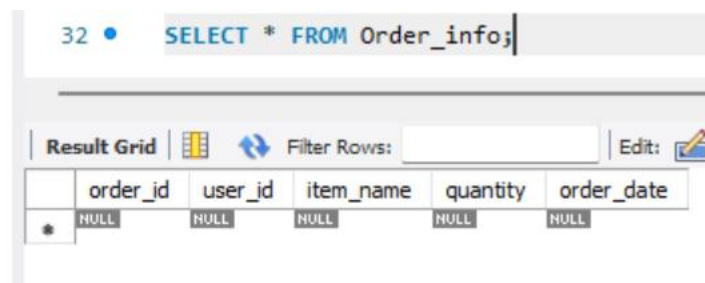

Query –

```
CREATE TABLE Order_info (  
    order_id INT AUTO_INCREMENT PRIMARY KEY,  
    user_id INT,  
    item_name VARCHAR(30),  
    quantity INT,  
    order_date DATE  
);
```

	Field	Type	Null	Key	Default	Extra
▶	order_id	int	NO	PRI	NULL	auto_increment
	user_id	int	YES		NULL	
	item_name	varchar(30)	YES		NULL	
	quantity	int	YES		NULL	
	order_date	date	YES		NULL	

Figure 3 Order_info: Database (local DB)

	order_id	user_id	item_name	quantity	order_date
*	NULL	NULL	NULL	NULL	NULL

Figure 4 Order_info Table with no data

Inventory table (in remote **GCP** DB) with attributes: item_id, item_name, available_quantity

Query –

```
CREATE TABLE Inventory (  
    item_id INT AUTO_INCREMENT PRIMARY KEY,  
    item_name VARCHAR(30),  
    available_quantity INT  
);
```

```
mysql> DESCRIBE Inventory;  
+-----+-----+-----+-----+-----+-----+  
| Field          | Type      | Null | Key | Default | Extra          |  
+-----+-----+-----+-----+-----+-----+  
| item_id        | int       | NO   | PRI | NULL    | auto_increment |  
| item_name      | varchar(30) | YES  |     | NULL    |                |  
| available_quantity | int       | YES  |     | NULL    |                |  
+-----+-----+-----+-----+-----+-----+  
3 rows in set (0.21 sec)
```

Figure 5 Inventory: Database (remote DB)

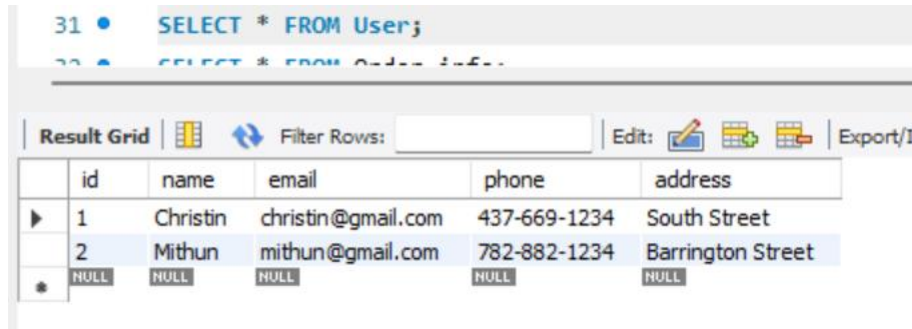

Task 2:

Insert some sample/dummy data in the above tables.

```
INSERT INTO User (name, email, phone, address) VALUES
```

```
('Christin', 'christin@gmail.com', '437-669-1234', 'South Street'),
```

```
('Mithun', 'mithun@gmail.com', '782-882-1234', 'Barrington Street');
```

The screenshot shows a database query window with the SQL statement `SELECT * FROM User;` executed. Below the query, there is a toolbar with options like 'Result Grid', 'Filter Rows', 'Edit', and 'Export'. The main area displays a table with the following data:

	id	name	email	phone	address
▶	1	Christin	christin@gmail.com	437-669-1234	South Street
	2	Mithun	mithun@gmail.com	782-882-1234	Barrington Street
*	NULL	NULL	NULL	NULL	NULL

Figure 6 User Table with dummy data

```
INSERT INTO Order_info (user_id, item_name, quantity, order_date) VALUES
```

```
(1, 'Pixel 8', 2, '2024-02-15'),
```

```
(2, 'Bread', 5, '2024-02-16');
```

The screenshot shows a database query window with the SQL statement `SELECT * FROM Order_info;` executed. Below the query, there is a toolbar with options like 'Result Grid', 'Filter Rows', 'Edit', and 'Export'. The main area displays a table with the following data:

	order_id	user_id	item_name	quantity	order_date
▶	1	1	Pixel 8	2	2024-02-15
	2	2	Bread	5	2024-02-16
*	NULL	NULL	NULL	NULL	NULL

Figure 7 Order_info Table with dummy data

```
INSERT INTO Inventory (item_name, available_quantity) VALUES
```

```
('Pixel 8', 48),
```

```
('Bread', 56),
```

```
('Lenovo Laptop', 27),
```

```
('iPhone 15', 39);
```

```
mysql> SELECT * FROM Inventory;
+-----+-----+-----+
| item_id | item_name      | available_quantity |
+-----+-----+-----+
| 1       | Pixel 8        | 48                 |
| 2       | Bread          | 56                 |
| 3       | Lenovo Laptop  | 27                 |
| 4       | iPhone 15      | 39                 |
+-----+-----+-----+
4 rows in set (0.21 sec)
```

Figure 8 Inventory Table with dummy data

Task 3:

Write a Java program that does the following:

- A. Fetch and display all item details from the remote database table (Inventory table).
- B. User enters details about item for which an order is to be placed.
- C. Insert the order details into local database table (Order_info table).
- D. Upon successful insertion, Update the item's quantity information in the remote database table (Inventory table).

Ques. Explanation about the program flow and what each component does.

Ans. Step 1: First, we initialize some variables to connect to the local and remote database using JDBC.

Step 2: Create a main method that executes three functions: 'displayInventory()' to display the inventory details from the remote database, 'userOrder()' to get information from the user for the order, and 'insertOrderDetails(order)' which takes the order object from the users and adds the order details to 'Order_info' table. If the order is inserted successfully, we then invoke 'updateInventory(order)' which updates the remote database based on the number of products ordered.

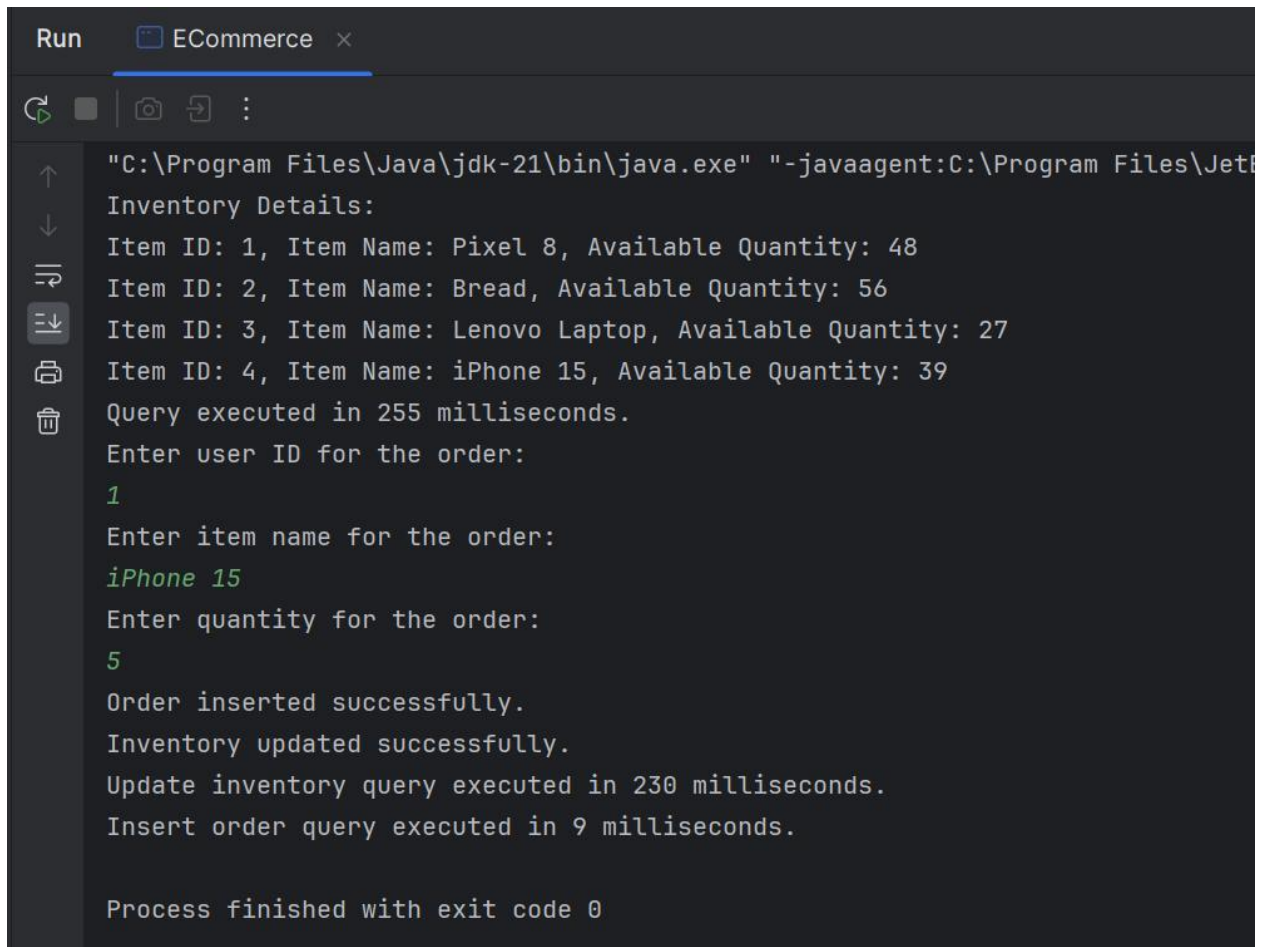

Step 3: 'displayInventory()' – Establish connection with the remote database. Execute the query to gather all the records from the 'Inventory' table. Iterate over the ResultSet to display each record from the table. Calculate execution time using 'System.currentTimeMillis()'.

Step 4: 'userOrder()' – A simple function to ask for the user's input to get the order details, and finally, store the input in an 'Order' object.

Step 5: 'insertOrderDetails(Order order)' – Establish connection with the local database. Prepare a SQL insertion operation on the 'Order_info' table. If the operation is successful, 'updateInventory(order)' is invoked. Calculate execution time.

Step 6: 'updateInventory(Order order)' – Establish connection with the remote database. Prepare a SQL update operation on the 'Inventory' table. Print the operation status accordingly. Finally, print the execution time for the operation.

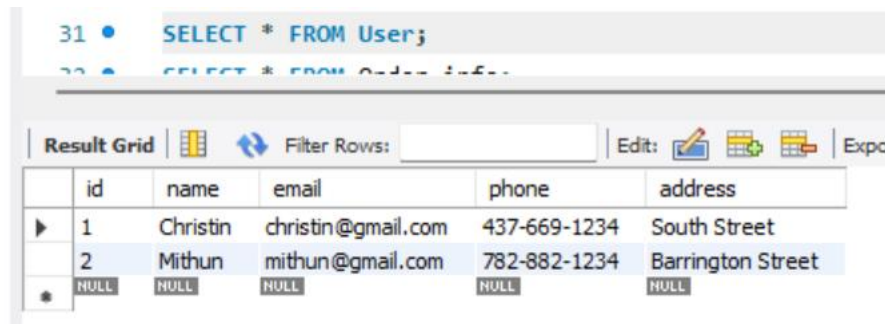

Screenshots of the tables after the program execution & user selection.

```
Run ECommerce x
"C:\Program Files\Java\jdk-21\bin\java.exe" "-javaagent:C:\Program Files\Jet
Inventory Details:
Item ID: 1, Item Name: Pixel 8, Available Quantity: 48
Item ID: 2, Item Name: Bread, Available Quantity: 56
Item ID: 3, Item Name: Lenovo Laptop, Available Quantity: 27
Item ID: 4, Item Name: iPhone 15, Available Quantity: 39
Query executed in 255 milliseconds.
Enter user ID for the order:
1
Enter item name for the order:
iPhone 15
Enter quantity for the order:
5
Order inserted successfully.
Inventory updated successfully.
Update inventory query executed in 230 milliseconds.
Insert order query executed in 9 milliseconds.

Process finished with exit code 0
```

Figure 9 Java Program Output

	id	name	email	phone	address
▶	1	Christin	christin@gmail.com	437-669-1234	South Street
	2	Mithun	mithun@gmail.com	782-882-1234	Barrington Street
*	NULL	NULL	NULL	NULL	NULL

| 2 | Bread | 56 |
| 3 | Lenovo Laptop | 27 |
| 4 | iPhone 15 | 34 |
+-----+-----+-----+
4 rows in set (0.20 sec)
```

Figure 12 Inventory Table after the program execution

Task 4:

Calculate & display the SQL query execution time in milliseconds at STEPS-A, C & D.

```
Run ECommerce x
"C:\Program Files\Java\jdk-21\bin\java.exe" "-javaagent:C:\Program Files\Jet
Inventory Details:
Item ID: 1, Item Name: Pixel 8, Available Quantity: 48
Item ID: 2, Item Name: Bread, Available Quantity: 56
Item ID: 3, Item Name: Lenovo Laptop, Available Quantity: 27
Item ID: 4, Item Name: iPhone 15, Available Quantity: 39
Query executed in 255 milliseconds.
Enter user ID for the order:
1
Enter item name for the order:
iPhone 15
Enter quantity for the order:
5
Order inserted successfully.
Inventory updated successfully.
Update inventory query executed in 230 milliseconds.
Insert order query executed in 9 milliseconds.

Process finished with exit code 0
```

Figure 13 Java Program Output containing the query execution time in milliseconds

Ques. Provide brief explanation about why there is a difference in the execution time for performing operation on local database and on remote database.

Ans. Local databases are accessed on the same machine, which means there is less distance for data to travel. In contrast, remote databases are hosted in a cloud environment, such as Google Cloud Platform (GCP), and are in a specific geographic location. Because of this, data needs to travel over the internet, which can be affected by network latency. The closer the remote database is to the accessing machine, the lower the latency.
